ABSTRACT OF THE DISCLOSURE

A pluggable optical transceiver module is described. The pluggable optical transceiver module has an optical fiber connecting interface, a transceiver, a golden finger connecting interface. The optical fiber connecting interface couples with an optical fiber to transmit optical signals to other devices. The transceiver transforms output electrical signals into output optical signals for delivery by the optical fiber connecting interface, and input optical signals into input electrical signals. The golden finger connecting interface transmits the output electrical signals and the input electrical signals of the pluggable optical transceiver module.
